Week 8 Practical

Task 1: Create Azure Budget Alerts

The screenshot displays the Microsoft Azure Billing account interface for 'mbali maso'. The 'Summary' tab is selected, showing a balance of \$0.00 and no payment needed. The 'Upcoming invoices' section indicates the next invoice is available on 6/9/2026 for the period 5/1/2026 - 5/31/2026. The 'Invoices over time' section shows a chart with values 100, 80, 60, 40, 20, and 0.

This is where I would have completed the practical if my subscription was active.

I would have navigated to the Cost Management and Billing section to set up a budget scoped to my subscription with a limit of 100 dollars. I would have configured two alert thresholds at 80 percent and 100 percent of the budget to ensure I received early warnings before reaching the spending limit. My student email would have been added as the recipient to receive these automated notifications and I would have captured a screenshot of the final budget configuration showing these specific thresholds and the scope.

Task 2: Monitor Usage and Adjust Resource Settings

I would have used the Cost Analysis view to break down my spending by resource type and identified which services were consuming the most of my 100 dollar budget. After identifying the highest cost resources I would have resized a virtual machine to a lower tier or deallocated unused resources to reduce daily spend. I would have documented the state before and after this change to estimate how much these adjustments would reduce my projected monthly costs.
