Give feedback

I did not have access to Microsoft Entra ID because my Azure subscription expired before I could complete the practical. The answers below explain what I would have done in the Azure portal to complete the activity.

Task 1: Plan Your Identity Structure

Naming Convention

I would have used the username format `firstname.lastname@projorion.onmicrosoft.com` because it keeps accounts organized, easy to identify, and simplifies user management in a business environment.

Group Design Rationale

I would have used Security groups because they are designed for managing permissions and controlling access to Azure resources through Azure RBAC. Microsoft 365 groups are mainly focused on collaboration tools such as Teams and Outlook.

Principle of Least Privilege

The Principle of Least Privilege means users should only receive the minimum access needed to perform their jobs. This helps reduce security risks, prevent accidental changes, and improve overall access control.

Task 2: Create Users and Groups in Entra ID

2a-Create User Accounts

I would have created six user accounts with usernames following the naming convention, department information, job titles, and temporary passwords. Two users would have been created for each department: Development, Operations, and Finance.

2b-Create Security Groups

I would have created the groups proj-orion-dev, proj-orion-ops, and proj-orion-finance, then added the correct users to each group. Each user would only belong to one group to keep permission management simple and organized.

Membership Type

I would have used Assigned membership because the users would have been added manually in a small environment. Dynamic membership would be more suitable in larger organizations where users are automatically added based on attributes such as department or job title.

Verification Step

I would have checked the Members section inside each group in Microsoft Entra ID to confirm the correct users were added. A screenshot of one group's members list would have been included as evidence.

Task 3: Assign Initial Roles

Role Justification

I would have assigned Contributor to the development group because developers need to create and manage resources. I would have assigned Reader to the operations group because they only need to monitor resources. Finance users would have received billing-related Reader access because they only require access to cost and billing information.

Scope Matters

I would have assigned the roles at Subscription scope because it simplifies administration across all project resources. Broader scopes are easier to manage, while narrower scopes provide better security but require more administration.

Custom vs Built-In Roles

Custom roles are created when built-in Azure roles do not provide the exact permissions required by an organization. This allows companies to give users only the permissions they need without granting unnecessary access.
