

Azure Monitor

The collected data would be stored in the storage that has been created. These screenshots shows the overview page of the monitor as well as an more focused view about CPU percentage

Summary of Monitoring

When viewing these I did not notice something unexpected

Alerts

I was unable to create an alert with the current subscription, but I would set an alert when the available memory % exceeds 90% for 10 mins straight since this would slow down the machine. Having an alert set up would be in the best interest since you won't have slow performance for too long.
