

Week 3

Overview

In Week 3 I set up an Azure Virtual Machine from the beginning without using any templates. I made a Standard_B1s VM called TechBridge-VM that runs Ubuntu Server 22.04 LTS. This TechBridge-VM is the most affordable size. It has 1 vCPU and 1GB of RAM. I connected this TechBridge-VM to my existing TechBridge-VNet. I put it in the Public-Subnet so it can get internet traffic. I made a public IP address called TechBridge-VM-PIP. I set it to be Static, not Dynamic. This means the IP address will not change when I restart the TechBridge-VM. For security I checked the Network Security Group rules. I made sure that only my IP address can access the TechBridge-VM using SSH. I also turned on the auto-shutdown feature for the TechBridge-VM. I set it to turn off automatically at 7:00 PM every day. I also set it to send an email to my student email when it shuts down. This is very important, for managing costs. If the TechBridge-VM runs all the time it will use up Azure credits when I am not working on the project. I wrote down all the details of the TechBridge-VM. These include the name of the TechBridge-VM, the region, the size, the operating system the VNet address space, the subnet CIDR, the public IP and the auto-shutdown configuration.
