

WEEK 7 PRACTICALS

Enabling monitoring on VM:

This is where I would have enabled monitoring on a vm. But I was restricted to create or assign it to vm. I would start by accessing the virtual machine blade or overview and navigate to monitoring.

Enabling network monitoring on network resources:

PRODUCTIONNSG - Microsoft Azure

REVIEW KEY METRICS:

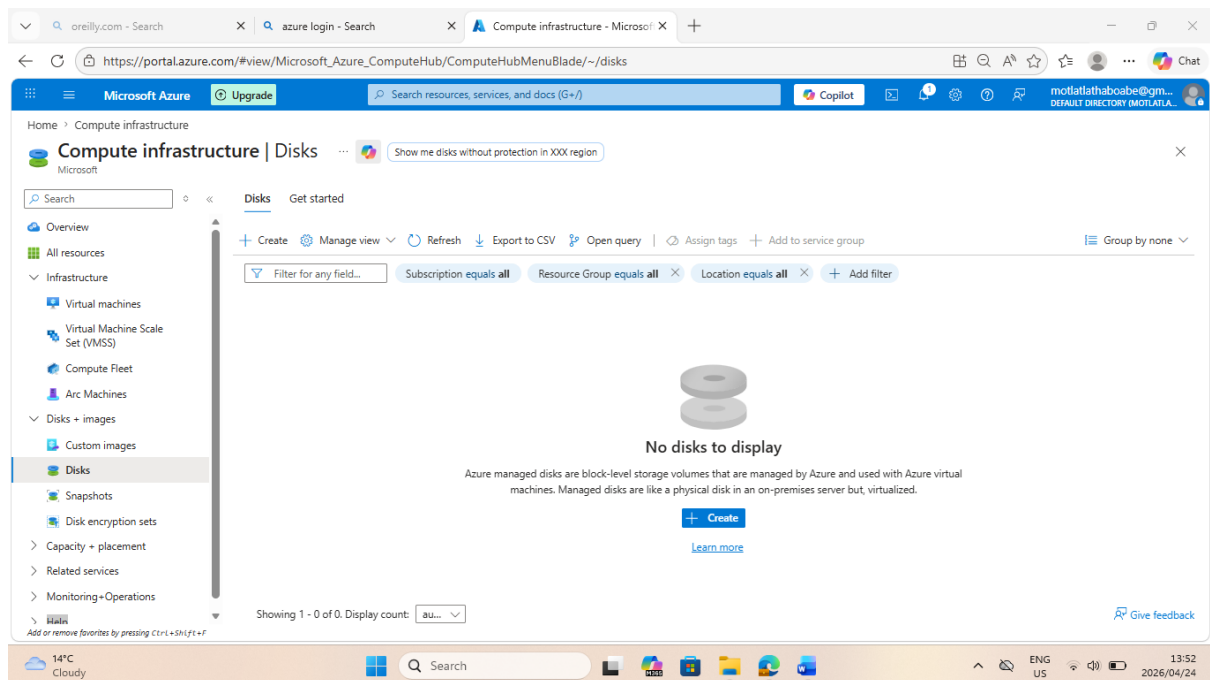

The subscription was limiting me but I tried to navigate to where I would check a vm's cpu

Network metrics:

DISK METRICS:

I could not reveal disk metrics due to subscription limitations but managed to locate where I would perform the configuration.

DOCUMENT MONITORING SETUP

For resources monitored I could not directly monitor the vm due to subscription limitations but I managed to navigate to azure monitor to understand where to navigate to incase I want to monitor a resource such as a virtual machine. In terms of data storage and retention I could not store any data or create any storage resource due to subscription limitations. In terms of metrics(cpu, memory, requests) I could not get a reading of the actual metrics because of subscription limitations.
