

Defender for Cloud was enabled on the subscription. At the time of the security review the environment was newly deployed and recommendations were still loading. Two high-severity issues were proactively addressed before Defender completed its assessment: open RDP port was restricted to My IP only, and OS periodic assessment was enabled for automatic update detection.

Cost Optimisation Actions:

VMs were deleted or deallocated after each practical session to avoid unnecessary compute charges. LRS replication was chosen for the storage account as it is the most cost-effective option for a learning environment with no disaster recovery requirement. The Hot access tier was selected as the repository is actively accessed during practicals.

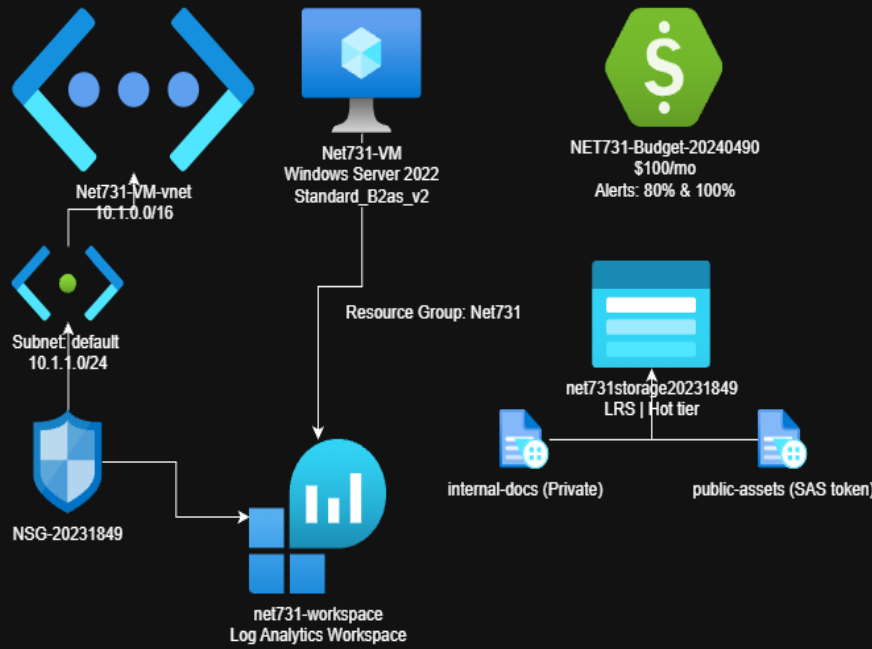

Projected Final Spend:

Based on current usage patterns, the projected total spend for the project period is estimated at under \$5.00 well within the \$100 budget.
