Week Practical 9

Task 1: Create an Architecture Diagram

I have produced a professional architecture diagram using tool libraries to represent the complete environment I built over the past nine weeks. The diagram maps out all resource groups, virtual networks, and subnets while indicating the specific placement of virtual machines and storage accounts. I have clearly labeled the network security groups attached to subnets and included monitoring components like the log analytics workspace. To ensure the documentation is functional for a handover, I have used official icons to show traffic flow between components and saved the final file in a dedicated diagrams folder.

Task 2: Document Full Azure Environment

I have authored a comprehensive technical report in markdown format that details every major aspect of the infrastructure deployment. This report categorizes each resource by its name, region, and sku while explaining its specific purpose and any dependencies on other services. I have included a dedicated security section listing all network security group rules, assigned roles, and addressed security recommendations to demonstrate a layered defense strategy. Furthermore, I have detailed the monitoring setup by describing the active metrics and alert rules alongside a cost summary that breaks down the final spending and optimization steps taken.
