

WEEK 9 PRACTICALS

1.Network Architecture

Documenting full azure resources

In terms of resources and configuration the resources I created were a virtual machine and virtual network which were containerized with a resource group. My virtual machine was placed in east us region based on linux ubuntu image, standard ds1 v2 size. I then assigned the virtual machine to a virtual network in order for it to be in an isolated network space. In terms of security and configuration the vnet will allow all inbound traffic with a priority of 65000 to be prioritized as well as an outbound security rule which will define all outward with a priority of 65000. In terms of monitoring infrastructure I navigated to azure monitor and went to vm insights to gain knowledge of cpu utilization of the virtual machine in my environment. Some of my resources were unusable due to subscription limitation problems I experienced after my free trial subscription expired.
