

Azure Budget alerts

I set an forecasted cost at 50% of the budget since this will give me an idea roughly where the budget would be and then i added alerts for when it actually hits 50,75 and 80% this will allow me to preemptively adjust before it is to late

Monitor Usage

After reviewing the cost analysis, I found that i am not spending anything on any resources. But if I had my VM on the list I would evaluate if it needed to be running as much as it is and if not then I would stop it from running as much to reduce the running cost.
