

WEEK 6 PRACTICALS

SECURITY POSTURE ASSESSMENT

The screenshot shows the Microsoft Defender for Cloud Overview page in the Azure portal. The page displays the following metrics:

- Azure subscriptions: 1
- Assessed resources: 0
- Attack paths: 0
- Security alerts: 0

The Security posture section shows:

- Critical recommendations: 0
- Attack paths: 0
- Overdue recommendations: 0/0

The Environment risk and secure score section shows:

- All recommendations by risk (0): Critical (0), High (0), Medium (0), Low (0)
- Total secure score: N/A

On the right, there are two informational panels:

- Utilize the Permissions Management capability in Defender CSPM:** Explains how CIEM empowers security admins to identify overprovisioned, unused, and super identities.
- Upgrade to new Defender CSPM plan:** Explains how Defender Cloud Security Posture Management (CSPM) provides enhanced posture capabilities.

REMEDIATION

The screenshot shows the 'Add outbound security rule' dialog for the PRODUCTIONNSG network security group. The dialog includes the following fields:

- Destination port ranges:** 3389
- Protocol:** Any
- Action:** Deny
- Priority:** 120
- Name:** (empty)
- Description:** Close port 3389

The dialog has 'Add' and 'Cancel' buttons at the bottom.

I could not assign the nsg to a vm due to subscription limitations but I did my best to show how I would have assigned them to the vm.

This is where I would have applied the azure update to a virtual machine
