

WEEK 10 PRACTICAL

Thabo Abe Motlatla

Student number-20240843

Networks FA3

Final presentation:

The network diagram I designed was based on network architecture that consisted of a virtual network and virtual machine inside that virtual network. The virtual network was also governed by network security group rules to enforce security. The resources vnet and vm were in a container. I chose an Ubuntu Linux Ubuntu virtual machine with a standard bs1 size as I felt it would suit my architecture. I configured inbound NSG rules to allow inbound from the internet and allow outbound traffic to the internet. In terms of monitoring I access Azure Monitor to gain insight of my resources such as CPU utilization on a virtual machine. In terms of costs management my I made a budget of \$80 but I did not exceed nor reach that due to subscription expiration. The challenges I encountered I would say are my free trial subscription expiring and not being able to properly configure some resources but I made an effort to indicate how I would've problems had I been able to gain access to another subscription. I would say I gained experience of Azure even though there were problems with subscription but there is still room for improvement.
